RIZAL TECHNOLOGICAL UNIVERSITY
Cities of Mandaluyong and Pasig
COLLEGE OF ARTS AND SCIENCES

This is to certify that the research result and innovation consist of improvements/modifications made on existing design, process or product,

“ADVANCING TO DIGITALIZATION: A WAGE CALCULATOR, INCOME TRACKER, AND ANALYZER FOR TRUCKING SERVICE BUSINESS”

of the Project/Developmental Study authored and prototyped/ developed by the following developer/s:

**ERICA MAE G. CRUZ
ARVIN H. CANDELARIA
JERSEY JADE G. DELA CRUZ
JAMES S. FRANCISCO
JOHN REX LEGASPI
PIERRE NICOLE J. OCAMPO
DAN KARLO M. VULLAG
MYLENE C. PRADO**

was adopted and utilized at **Rizal Technological University**

Issued on the 21st day of May 2024, Mandaluyong City, Philippines

MAY B. SOLIS
End-User

Description of the System

Trucking services are one of the essential components of the logistics and transportation industry that ensure the timely transportation of products and supplies across various regions. However, small trucking businesses, like E. A. Francisco Trucking, have difficulty keeping pace with administrative demands mainly due to their reliance on manual bookkeeping systems. As this industry continues to grow and change to digital advancements, these traditional methods have become more inefficient and prone to errors. Most small trucking businesses purely rely on manual bookkeeping techniques for their operations, meaning, all their business transactions are handwritten and stored in physical record books. Therefore, modernizing and streamlining their administrative operations can help the whole truck rental services industry.

The purpose of this system is to benefit businesses in the truck rental service industry by automating the computation of workers' pay, computation of total income, analysis of income, assistance to manual systems, and digital record-keeping. It can help the business process payroll more efficiently, ensuring employees receive their salaries correctly and on time. It also aids in minimizing human mistakes which is a risk prone in manual bookkeeping. By digitizing records, the system improves data security and accessibility, ensuring necessary information is quickly accessible and safely stored. Implementing this automated system will not only significantly improve E.A. Francisco Trucking but also the whole trucking service industry, which may considerably expand administrative efficiency and general business productivity.

As the program starts, the user will choose a month they would like to view the details of, containing the driver's salary, crew/s' salary, and total income, and the analysis of the total income whether the total income falls below average or above average of their monthly income with the use of a bar plot. Once the month is selected, the program shows all the details for that entire month, displaying the information of the "Trip", "Payment", "Expenses", "Driver's Salary", "Crew/s' Salary", "Total Income", and "Income Category." Additionally, the program will present a visualization of the bar plot showing the total income for the entire month, indicating how many of the trips are below average or above average. Lastly, if the user wants to have a copy of the details of the selected month, there's an option to download an Excel file containing the detailed month's data.

Purpose

This program is intended to provide an automation program that would aid the administrative processes of truck rental services. Small trucking businesses still utilize manual bookkeeping systems for their operations wherein most of their business transactions are manually written and stored in record books and other paper-based documents. This system has its disadvantages and this program intends to be a more reliable and efficient computerized system that would provide the following:

Automated Computation of Workers' Pay

For commission-based salaries in trucking services, workers' pay is computed out of the portion of payment received for each trip they worked in.

Businesses with a manual bookkeeping system tend to manually calculate these salaries derived from records of business transactions which were manually encoded as well—these processes accumulate time. To help expedite the process, this program provides an automated computation of each worker's pay based on the calculations utilized in the business operations.

Automated Computation of Total Income

A comprehensive computation of income comes from thorough recordkeeping that keeps track of every single payment and expense. In trucking services, these details include each trip's payment and their respective expenses on gas, toll fees, crew meals, and/or ferry fees. The use of a computerized system would help prevent the exhaustive process of manually encoding this pertinent information. To aid trucking business operations, this program provides an automated computation of the businesses' total income per trip.

Automated Analysis of Income

E. A. Francisco Trucking does not currently hold formal business reports to keep track of its income over time and analysis thereof. The lack of this business practice is commonly shared among other small businesses that may not have the resources to do so. Using the data from the automated computation of total income, this program intends to present an analysis of the computed total income and interpret whether the income generated per trip is above or below the average income of the month. Trucking services may use this information to oversee business revenue over time, anticipate financial performance, and create development strategies for the business.

Assistance to Manual System Using Automation

The use of a manual bookkeeping system has its share of disadvantages that affect business operations. This includes the time-consuming process of manually recording business transactions and the human error that comes with manual work. Using automation, this program intends to create more accurate and efficient work to aid with the manual processes that the business may still utilize.

Digital Recordkeeping

In all its years of operation, E. A. Francisco Trucking had used physical record books to store every business transaction they have had. The business only uses Excel to record itemized business expenses needed for filing tax returns. To usher in a digital era for trucking businesses under similar situations, this program provides a recordkeeping system through Excel to store pertinent information about its business operation. Through this, there would be an ease in manually written records and the use of physical storage spaces.

Scope and Limitation of the System

This focuses on providing the administrators of Trucking Service Businesses with a program that would streamline the administrative processes. These processes only include the computation of workers' pay, computation of the business' gross income, and projection of the business' current financial performance through income analysis. To define the scope of this program, the programmers will enumerate the available data from E.A. Francisco Trucking,

which is the first target end-user of the program, used for the automated computations and analysis, and the results this automation will yield for each administrative process, with the program used for computation and analysis, this will ensure that the results for business are accurate and reliable instead of calculating manually.

Available Data from E.A Francisco Trucking

1. E. A. Francisco Trucking uses a record book to log all its business transactions complete with necessary trip details. The program only uses all the recorded transactions throughout the year 2023. The trip details recorded include the following:
 - a. Date
 - b. Location and Destination
 - c. Payment
 - d. Name of Workers per Trip
 - e. Computation of the Driver's and Crew/s' Commission per Trip

Workers' Pay Computation based on E.A. Francisco Trucking's Business Manual

1. The program follows the standing business operations of E. A. Francisco Trucking, this includes its workers' pay calculations. According to its administrator, workers are paid by commission per trip wherein helpers get ten percent (10%) of the trip payment after deducting trip expenses while drivers get twenty-five percent (25%) of the trip payment after deducting trip expenses and the total commission of the helpers.

2. E. A. Francisco Trucking pays its workers per cut-off or biweekly wherein all trips undertaken by workers for each two weeks are consolidated. This program follows this business procedure in automating the computation of the allotted total amount paid to each worker.
3. In the end, the program will only compute and display the total amount of each worker's pay per trip.

Total Income Computation per trip of E.A. Francisco Trucking

1. The program will only make use of all the trip details recorded in its record book to automate the computation of the business' total income per trip. For the sake of this program, the Gross Income will be computed as:

Total Payment Collected - Total Trip Expenses - Workers' Pay = Total Income

2. Total Payment Collected is the payment from the client per trip, Total Trip Expenses are the sum of all the expenses spent for the trip which includes: gas, toll fees, meals, and/or ferry fees, and the Workers' Pay is the sum of all the commissions of the crew/helpers and the driver.
3. In the end, the program will only compute the total gross income per trip.

Analysis of Current Financial Performance through Income Analysis based on E.A. Francisco Trucking's Average Total Income

1. Using the data computed from the automated computation of total income per trip, this program intends to present an analysis of the results of the computations to visualize the financial performance of E. A. Francisco Trucking.

However, with the wide scope of the program, there are still limitations and probable external factors that could cause a constraint in the functionality of the system. This includes:

1. The program is not made to record and/or summarize the total salary received by workers per cut-off.
2. The program is not made to calculate the total net income of the business due to other third-party expenses, such as, electric bill, water bill, and rent payment for truck parking.
3. The program is not made to forecast the future financial standing of the business.
4. The program is not made for other businesses that do not follow the same workers' compensation calculation from E.A. Francisco Trucking.

Definition of Terms

Income Category. The program categorizes the computed total income per trip in relation to the average total income in a month. The analysis is displayed indicating if the total income is "Below Average" or "Above Average" and visualizing these data through a bar graph. With the use of the program, the end-user could access this analysis and may use this information to oversee business revenue overtime, anticipate financial performance, and create development strategies for the business.

Income Analysis. The system will automatically analyze the total income per trip of the Trucking Service. This is displayed in the form of a bar plot wherein the Total

Income is on the x-axis, and Income Category is on the y-axis. This visualization will help the business in tracking their financial performance that could result to further improvements in their financial standing.

Total Income. The program computes the total income per trip after deducting trip expenses which includes gas, toll fees, workers' meals, and/or ferry fees. With the program, the end-user could access the computed total income per trip.

Trucking Service Businesses. The system will primarily help the business under Trucking Service industry. Since, trucking service is a form of ground freight that moves cargo from the location to the destination, there will be expenses, such as payment for diesel, and toll fee, additionally, this service will need a manpower, and each manpower needs to be paid. Therefore, this system will help the Trucking Service Businesses to digitally and more conveniently compute for their income, expenses, and the manpowers' salary.

Workers' Pay. The program computes the commission of each workers present per trip. Separate calculations are made for crews and drivers. Crews' commission is ten percent (10%) of the trip payment after deducting trip expenses. Drivers' commission is twenty-five percent (25%) of the trip payment after deducting trip expenses and the total commission of the crews present. With the program, the end-user could access the computed amount of pay a crew and a driver would receive per trip.

Systems Available in Global Market

In the global market, there are numerous automated payroll systems catering to various industries, such as In-House Payroll, Bookkeepers/CPA-managed payroll, Agency-managed payroll, and Software-managed payroll. However, the trucking services industry frequently confronts specific issues that necessitate specialized solutions. Existing payroll software such as PayFit, QuickBooks, PayCaptain, PayHub and many more provide generic functionality for managing payroll across several industries, but they may lack specialized features aimed at the complexities of the trucking business.

In the existing payroll systems like payroll software, there are still several disadvantages including limited customization, security risk, technical issues, and data accessibility. These existing systems may lack the functionality required for managing particular aspects of payroll, resulting in manual fixes and additional administrative work. In addition, the program may occasionally fail to function properly, resulting in delays in employee payments or tax computation. Lastly, considering payroll software services rely on a third party to process and store payroll information, there is a risk of data loss with present payroll capacity, which increases the possibility that essential payroll data would be accidentally erased or hacked. Also, when these systems perform income analysis, they mostly require access to detailed financial data of the business including the income and expenses. This may include sensitive information like operational expenses, employee salaries, and other financial data. That is why if the software is not secured, it can lead to data breaches and unauthorized access.

In contrast, our automated system offers features like real-time visibility of payroll data, offering better decision-making and expense control. It offers features to the users in customizable reporting, putting in the month, to review expenses, employees' salaries, and overall income, possibly improving operational efficiency.

Additionally, from the data in the system, it will present the visualization of a bar plot showing the total income for the whole month, indicating the number of trips below average and above average. The trucking services may use this to control the revenue of business over time, predict financial performance, and develop business development strategies. Overall, even though existing payroll systems serve a wide range of businesses, they may not meet specific needs for the trucking services industry. Our custom-made automated trucking services system offers certain functionality that can increase efficiency, making it a one-of-a-kind and important tool for trucking businesses.

Enhancement

The following enhancements to be made for our proposed system in the future would be:

End-User Accessibility (Transparency)

With this function, employees can also see their salary biweekly by logging in with their employee number, ID, or password.

In this scenario, X (the employee) wants to know his calculated salary biweekly, so there will be a function for him to calculate his salary biweekly from scratch. In

this way, he will know his forecast salary report. Also, this function will allow him to secure his identity by End-to-end Encryption.

End-to-end Encryption

The computation results are only accessible to the employee who generated them, and they can delete the drafts themselves. Each employee will receive a system-generated password to ensure the privacy of their reports. Furthermore, the employers can communicate with them privately.

Maximum Numbers Capacity

In this program, we will limit the number of accesses to ensure smooth and secure operations. For instance, a company's employers will only be able to have a maximum of 50 certified employees accessing the system. This restriction by capacity will prevent unauthorized log-ins and ensure that the system remains exclusive to certified employees, preventing any suspicious activities.

Other available options:

Report Option 1

In this software program, employees can quickly submit their transactions by visiting the designated site and selecting the report option. The software can track employees' GPS locations using the phone numbers registered in the system.

In a situation where an employee (referred to as "X") visits the wrong location and remains stationary, the GPS locator detects this and prompts the employer to use the dial option in the software to immediately contact the employee and assess the situation.

Admin Task or HR Role

Suppose Admins like HR wanted to add or change the employees' wage percentage based on the work demand. They included employees' night differential fees, holiday incentives, performance bonuses, and salary tax deductions based on the high or low-income employees' have.

Like End-user Accessibility, the admin task or HR role function can change employees' salary-based performance in the tracking, and even the employees can see it directly on their mobile phones.

Mobile App

Not only both employers and employees can search for it on the website, but they can also download it on Play Store to track their records or salary history.

User Manual

To use the program, follow these step-by-step instructions:

1. Ensure that the R and RStudio applications are installed on the computer to run the program.

2. Download the source code of the program.

3. Launch the RStudio application by clicking the RStudio icon. Then, on the upper left corner of the software, select File> New file> RScript.

5. After pasting the source code, make sure that all the packages have been installed. On the lower right side of the studio under “Packages”, search for the package name such as “shiny”, “readxl”, “dplyr”, “writexl”, and “ggplot2” and click the box beside it.

6. Before running the program, make sure that the Excel file location is on the same path as where the Excel file is located on your computer. Then, after that click “Run” on the upper right part where the code is pasted to run the code.

7. Then, the program will pop up. To navigate the program, choose from the drop-down the desired month and the program will automatically generate the details for the month chosen. Scroll down for the visualization of the income analysis.

8. Download the details of the chosen month by clicking the “Download Excel” button. Save the new Excel file to your computer.

9. Lastly, go back to the RStudio, and save the RScript by clicking File > Save as > Save.

APPENDIX

DOCUMENTATION

Arrival at the E. A. Francisco Trucking headquarters on May 18, 2024.

The programmers were handed the E. A. Francisco Trucking official record book to encode the necessary data used in the program.

Encoding of trip details from the E. A. Francisco Trucking official record book to the Excel file used by the program. Trip details included were: 1) Destination; 2) Payment; 3) Trip Expenses; and 4) Number of Crew.

The programmer explains what data from the E. A. Francisco Trucking official record book were used in the program and how the program follows the calculations on its business manual.

The programmer demonstrates the functions of the program and how it will aid in the administrative processes of E. A. Francisco Trucking to May Solis, its administrator.

Handing of evaluation form to May Solis, administrator of E. A. Francisco Trucking, after the program demonstration for her assessment as the end user of the program.

May Solis, administrator of E. A. Francisco Trucking, answering the program's evaluation form, The System Usability Scale (SUS): Post-Test Assessment of Usability.

May Solis, administrator of E. A. Francisco Trucking, asking further questions and clarifications regarding the program as she answers the evaluation form.

EVALUATION

The System Usability Scale (SUS): Post-Test Assessment of Usability

Please rate your experience using the system by putting a check mark in Strongly Disagree (SD), Disagree (D), or Moderately Agree (MA), or Agree (A), and As Strongly Agree (SA).

STATEMENTS	1	2	3	4	5
1. I think that I would like to use this system frequently.					✓
2. I found the system unnecessarily complex.		✓			
3. I thought the system was easy to use.				✓	
4. I think that I would need the support of a technical person to be able to use this system.		✓			
5. I found the various functions in this system were well integrated.					✓
6. I thought there was too much inconsistency in this system.		✓			
7. I would imagine that most people would learn to use this system very quickly.					✓
8. I found the system very cumbersome to use.				✓	
9. I felt very confident using the system.					✓
10. I needed to learn a lot of things before I could get going with this system.	✓
